"Changing Farmers' Mindset from "Grow and Sell" to "Grow to Sell""

TOMATO PRODUCTION

Prepared by SHEP PLUS

Photos: SHEP PLUS

Training Title: Tomato Production

Objective: To provide a guideline on production of Tomato

Specific Objective:

To provide basic information on production, post-harvest handling, and marketing of Tomato

Contents:

- 1. Introduction: Background, Common Varieties and Optimal Ecological Requirements
- 2. Pre-Cultivation Preparation 1 5
- 3. Cultural Practices 1- 10
- 4. Harvest
- 5. Post-Harvest Handling
- 6. Cost & Income Analysis
- 7. Post-Training Evaluation Exercise

Contacts:

- Ministry of Agriculture, Livestock & Fisheries (MOALF):

This publication was prepared under the Smallholder Horticulture Empowerment and Promotion Project for Local and Up-Scaling (SHEP PLUS) on behalf of Ministry of Agriculture.

Preface

- This training material applies the fundamental practices essential for crop production and successful marketing to put into perspective the case of horticultural crop production.
- The fundamental practices are categorized into seven (7) broad topics and twenty (20) sub-topics; the twenty sub-topics are referred to as the General Horticulture Crop Production and Post-Harvest Handling Techniques (GHCP&PHHT20). This categorization is based on the Smallholder Horticulture Empowerment & Promotion Unit Project (SHEP UP) experience in mitigating production and marketing challenges facing smallholder horticultural farmers.
- The seven (7) broad topics are: Pre-Cultivation Preparation; Land Preparation; Crop Establishment (Planting/Transplanting); Crop Management; Harvest; Post-Harvest Handling: and Cost and Income Analysis.
- The sub-topics under each topic are as follows: **Pre-Cultivation Preparation** (market survey, crop planting calendar(s), soil sampling & analysis, composting, and quality seed/planting material(s)); **Land Preparation** (land preparation practices, incorporation of crop residues, and basal application); **Crop Establishment** (raising seedlings, planting/transplanting, fertilizer application); **Crop Management** (water requirement, managing of weeds, top-dressing, pests & diseases management practices, and safe & effective use of pesticides); **Harvest** (harvesting indices); **Post-Harvest Handling** (appropriate containers/standard packaging materials, and value addition techniques); and **Cost and Income Analysis** (cost and income analysis).
- The issues outlined in the twenty (20) sub-topics might not necessarily be applicable in all cases. But where applicable, it is recommended that the instructions issued be given due consideration.

1. Introduction:

1.1 Background

Tomato (Nyanya)

1. Introduction:

1.1 Background

Tomato (Nyanya)

1. Introduction:

1.1 Background

- Tomato is a member of the Solanaceae family which includes crops such as Irish Potato, Sweet Pepper, Chili and Egg Plant
- One of the most produced and consumed vegetables in Kenya
- Important cash crop for smallholder farmers
- Mainly grown in open fields, however green house tomato production is growing in popularity
- Rich in Vitamin A, C and Lycopene
- Eaten fresh, added to salads, cooked as a vegetable or processed into tomato paste, jam, sauce, puree, and juice

1.2 Common Varieties

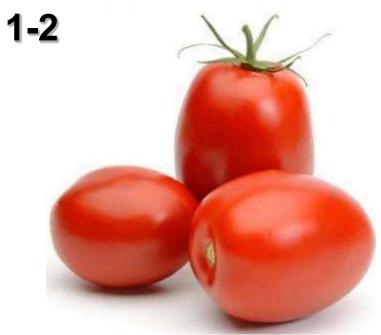

Photo: Flora fields http://www.florafields.com/index.php?route=product/product&product_id=189

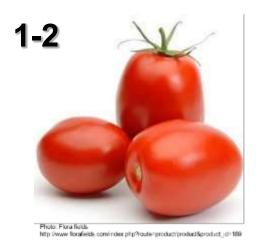

"Rio Grande" (Determinate)

Photo: seminis, https://seminis.co.za/product/assila/686

"Assila F1" (Determinate)

1.2 Common Varieties

"Rio Grande" (Determinate)

The second contracts of the second contract of the s

"Assila F1" (Determinate)

Determinate Varieties

"Rio Grande":

- Fresh market and processing variety
- Plant is slightly bushy and can be staked or left unstaked
- Tolerant to verticillium and fusarium wilt
- Maturity Period: 75 85 days after transplanting
- Yield: 18,000kg per acre

"Assila F1"

- **Determinate** early maturing (**75 days)** variety
- Tolerant to **Tomato Yellow Leaf Curl Virus** (TYLCV) & nematodes
- It produces fruits with attractive red colour with oval shape & heavy sweet fruits
- Yield: 23,000kg per acre
- Good keeping quality & transportability

"Kilele F1" (Determinate)

Photo: Farm Fresh Seeds http://www.farmfreshseeds.com/heirloom-tomato-seeds-cal-j.html

"Cal J" (Determinate)

Determinate Varieties Cont'

"Kilele F1"

- Medium-early maturing, determinate type
- Suitable for drier or humid areas
- Disease tolerance: Tomato Yellow Leaf Curl Virus, Tomato Mosaic Virus, Verticillium, Fusarium Wilt & Nematodes
- Fruits: Firm and elongated and has shelf life of 21 days
- Maturity Period: 75 days after transplanting
- Yield: 30,000 35,000 per acre

"Cal J"

- Open pollinated determinate variety
- Tolerant to verticilium & fusarium wilts
- The plant produces red blocky shaped fruits
- The fruits store and transport well
- Maturity Period: 75 85 days after transplanting
- Yield: 11,000 13,000kg per acre

Photo: seminis, https://seminis.co.za/product/eden/687

"Eden F1" (Determinate)

Photo: Kenya Highlands Seed Co. https://royalseed.biz/tomatoes

1.2 Common Varieties Cont'

"Eden F1"

- Determinate and vigorous growing variety
- Good tolerance to Alternaria Canker,
 Verticillium Wilt, Fusarium Wilt, Nematodes
 and Bacterial Speck
- Deep red blocky fruits have long shelf life
- Maturity Period: 75 days after transplanting
- Yield: 40,000-50,000kg per acre (9 10 kg per plant)

"Rambo F1"

- Determinate, vigorous plant with uniformly set and firm fruits
- Tolerance: Bacterial wilt, Bacterial spot,
 Fusarium wilt, Verticilium wilt and Nematodes
- Maturity 75 days after transplanting
- Yield: 30,000kg per acre
- Good shelf life & transport quality

"Anna F1" (Indeterminate)

"Anna F1" (Indeterminate)

1.2 Some Common Varieties Cont'

"Anna F1":

- Hybrid and indeterminate fresh market variety that produces blocky oval red fruits that have a long shelf life, tolerance to Fusarium, Verticillium Wilt, Alternaria Stem Canker and Nematodes
- Ideal greenhouse Tomato
- Maturity Period: 75 days after transplanting
- Yield: 64,000kg per acre (18 kg per plant for 8 months)

Other Determinate varieties grown in Kenya:

- Fortune Maker F1
- Novel
- Nuru
- Valoria F1
- Zawadi F1

Other Indeterminate varieties grown in Kenya:

- Nemoneta
- Tylka F1
- Prostar F1

1.3 Choice of Varieties

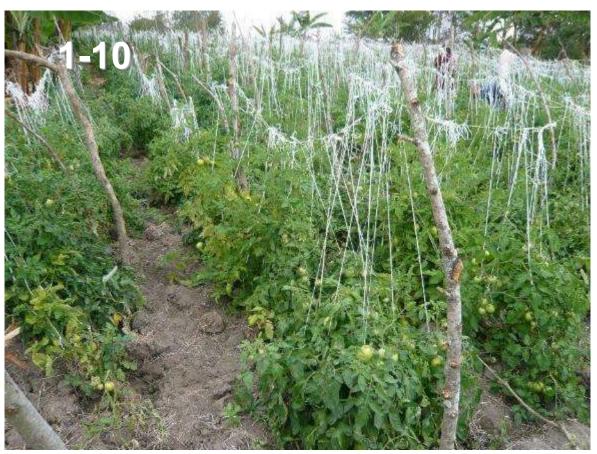

Photo: SHEP PLUS

Tomato crop in the field

1.3 Choice of Varieties

Photo: SHEP PLUS

Tomato crop in the field

1.3 Choice of Varieties

Selection of a variety needs to be based on:

- Growth Habit: determinate (bush), indeterminate (climbing) and semi-determinate
- Disease Resistance/Tolerance: indicated by initials after variety name e.g.) "F" for fusarium wilt, "N" for nematodes
- Fruit Type (shape, size & color): Market requirement will determine fruit type.
 - Processing-intense red color & more solids
 - Fresh market- shape, color & size vary
- Hybrid or Open Pollinated Varieties (OPV):
 Hybrid seeds give higher yields but are more expensive

1.4 Optimal Ecological Requirements

Altitude	0 – 2,000 metres above sea level
Rainfall	Over 600 mm of rainfall annually
Growing Temperature	20 – 25 °C (day) 15 – 17 °C (night)
Soils	 •Well drained sandy, loam, and clay loam soils •pH range 6.0 – 7.5

1.4 Optimal Ecological Requirements

Altitude	0 – 2,000 metres above sea level
Rainfall	Over 600 mm of rainfall annually
Growing Temperature	20 – 25 °C (day) 15 – 17 °C (night)
Soils	 Well drained sandy, loam, and clay loam soils pH range 6.0 – 7.5

1.4 Optimal Ecological Requirements

- Altitude: Tomato can be cultivated up to 2,000 m above sea level
- Rainfall: Tomato performs well in areas that receive over 600 mm of rainfall annually. It should be well distributed throughout the growing season.
- Temperature: Tomato performs well in warm climatic conditions. The optimal day and night temperature range is 20 25 °C and 15 17 °C, respectively
- Soil: Tomato requires well drained sandy loam, or clay loam soils. The optimal soil pH range is 6.0 7.5.

2.1 Crop Planting Calendar

A Sample of a Tomato Planting Calendar

A Sample of a Tomato Planting Calendar: Targeting a peak market demand beginning just after January

2.1 Crop Planting Calendar (GHCP&PHHT20: Q2)

 A tool used by farmers to plan for production to ensure that marketing coincides with the period of the year when the market price of a produce is highest

Procedure:

- 1. Determine from the market survey results (2.1) when there is peak demand for Tomato
- Work backwards from the month when there is peak demand to prepare a monthly farm activities preceding the peak period
- Use the monthly activities preceding the peak demand as a procurement plan for farm inputs and a guide for farm operations

Notes:

 To meet the peak demand period of the market, there may be need for supplemental irrigation

2.2 Composting

Manure preparation through composting

2.2 Composting

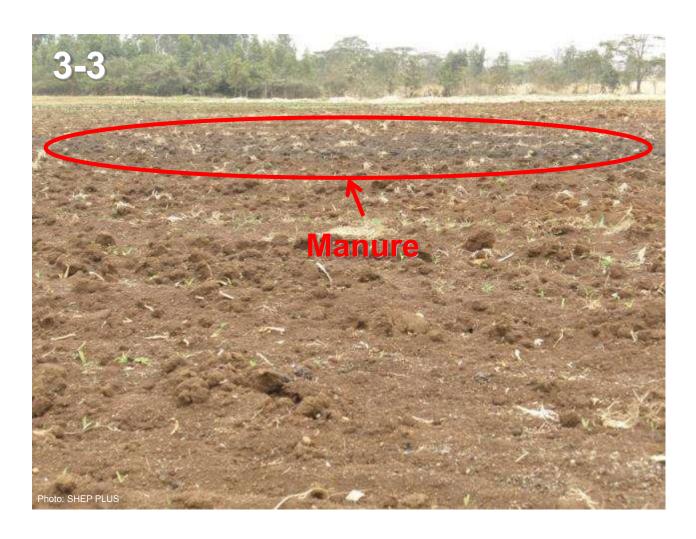

Manure preparation through composting

2.2 Composting (GHCP&PHHT20: Q4)

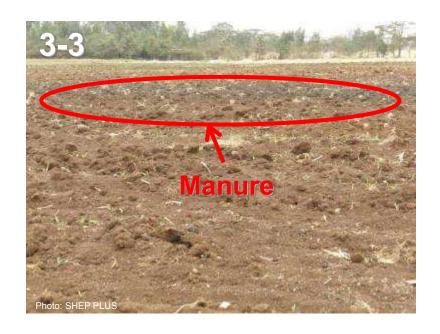

- During compost making, the organic matter need to be covered to prevent leaching and volatilization of nutrients
- Tomato is a heavy feeder and does well in soils with high organic content (manure)
- Based on the results of the soil analysis, prepare adequate compost for application; the recommended rate of application ranges from 5

3.1 Basal Application

Manure incorporation as a basal application

3.1 Basal Application

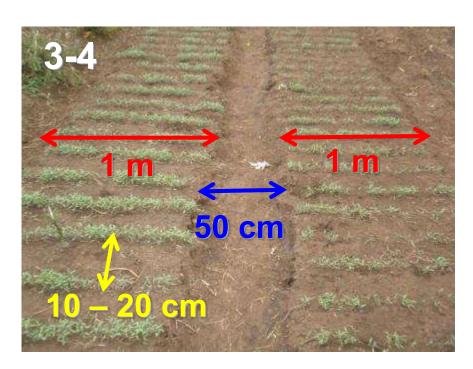

Manure incorporation as a basal application

3.1 Basal Application (GHCP&PHHT20: Q8)

- The manure/compost should be broadcasted (5 – 8 tons/acre) then worked into the soil (incorporated) preferably using a hoe
- Manure/compost should be applied 1 2
 weeks before transplanting the Tomato and
 incorporated into the soil

3.2 Raising Seedlings

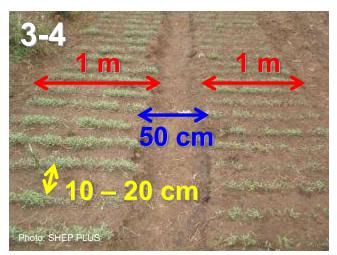

Photos: SHEP PLUS

Tomato nursery

3.2 Raising Seedlings

Tomato nursery

3.2 Raising Seedlings (GHCP&PHHT20: Q9)

- Tomato can be established through the nursery or directly seeded
- Normally, it is raised in nursery before transplanting
- The seed rate is about 40 75 g/acre
- Seed trays can also be used to raise seedlings

Nursery Site Selection:

- The nursery should be sited in a plot that has not been planted with a member of Solanaceae family for the last 3 years
- Choose the site with good drainage

Nursery Establishment:

- Prepare a seedbed of 1 m width and of a convenient length
- Make drills on the seedbed at a spacing of 10 20 cm apart
- Thinly sow the seeds in the drills and cover lightly with soil

Management of Nursery:

- Water the nursery regularly
- Harden the seedlings 1 2 weeks before transplanting by reducing the frequency of watering and gradually exposing the seedlings to direct sunlight
- Insects such as whiteflies can transmit viruses to young tomato plants hence should be controlled using pesticides e.g. Amitraz (Mitac 20EC®), Buprofezin (Applaud 40%SC®), Azadirachtin (Nimbecidine®), Imidacloprid (Confidor 70 WG®)
- These insects can be blocked from reaching the seedlings by use of an insect proof net (agricultural type)

3.3 Transplanting

Recently transplanted Tomato seedlings

3.3 Transplanting

Recently transplanted Tomato seedlings

3.5 Transplanting

3.5.1 Appropriate Time

- Seedlings are transplanted 30 45 days after seed sowing
- It is recommended that transplanting should be done either early in the morning or late in the evening

3.5.2 Recommended Spacing

(GHCP&PHHT20: Q10)

- Spacing: range from 75 100 cm (between rows) by 40 60 cm (between seedlings) depending on the variety
- Plant Population per Acre: range from 6,666 to 13,333
- Appropriate spacing produces short, stocky plants with good root system

3.5.3 Fertilizer Application Rates

(GHCP&PHHT20: Q11)

- Apply 2 3 handfuls of manure per planting hole (8 tons/acre)
- Apply 2 bottle tops (10 g) of Triple Super
 Phosphate (TSP) per planting hole (80 kg/acre
- Apply Muriate of Potash (MOP) to enhance availability of potassium

3.4 Water Requirement

Drip Irrigation in a Tomato field

3.4 Water Requirement

Furrow Irrigation in a Tomato field

3.4 Water Requirement (GHCP&PHHT20: Q12)

- Tomato is sensitive to water deficit:
 - Immediately after transplanting
 - During flowering and fruit development
- Plants should be provided with adequate water
- Tomato plants are sensitive to water logging and flooded fields should be drained within 1 3 days

Irrigation Methods:

- Furrow and drip irrigation are the most effective methods
- Furrow irrigation minimizes spread of fungal diseases, such as "Early Blight"
- Drip irrigation on the other hand is efficient on water utilization
- Overhead irrigation encourages spread of diseases such as "Early Blight"

3.5 Managing of Weeds

Tomato under good weed management

3.5 Managing of Weeds

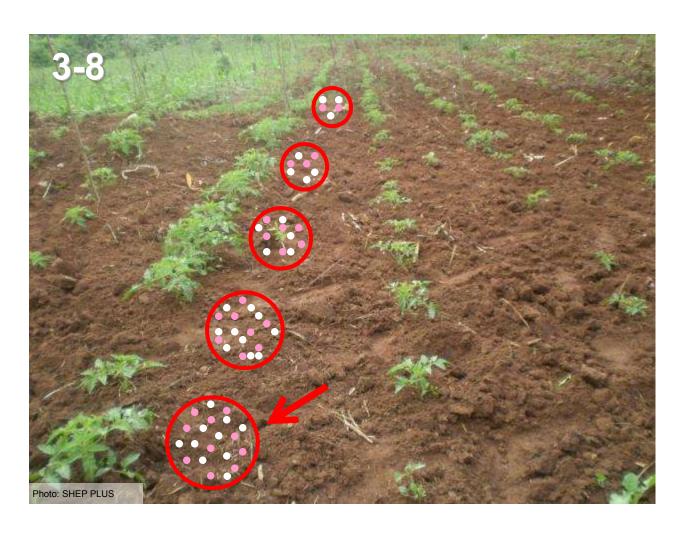

Tomato under good weed management

3.5 Managing of Weeds (GHCP&PHHT20: Q13)

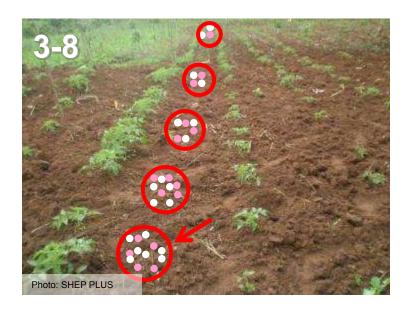

- Avoid bruising the roots during weeding
- This can be done through use of appropriate weeding tools
- Generally, keep the field weed free as much as possible to avoid competition for nutrients, sunlight and moisture
- Weeding Tomato field when the soil is wet can increase the spread of some bacterial (Bacterial Wilt) and fungal (Fusarium Wilt) diseases

3.6 Top-dressing

Top-dressing using the placement method

3.6 Top-dressing

Top-dressing using the placement method

3.6 Top-dressing (GHCP&PHHT20: Q14)

- Tomato crop should be fertilized with organic and inorganic chemical fertilizers to produce high yields
- Top-dressing fertilizer such as CAN should be applied in 2 splits at 40 kg & 80 kg/acre at 4 and 8 weeks after transplanting
- Application method: circular band around the stem
- Inadequate top-dressing can result into physiological disorders:
 - Hollow cavities and poor taste in fruits due to potassium deficiency
 - Blossom-end rot due to an imbalance between Nitrogen, Calcium and soil moisture

3.7 Crop Management3.7.1 Training & Staking

Well staked Tomato field

3.7 Crop Management3.7.1 Training & Staking

Well staked Tomato field

3.7 Crop Management3.7.1 Training and Staking

- Indeterminate varieties need staking/training to facilitate pruning, harvesting and other cultural practices
- Determinate varieties may be staked in wet season or mulched to prevent fruit contact with the soil
- Staking materials: wooden stakes, bamboo or any sturdy material
- Strings, plastic strips or other material can be used to train the plant to the stake

3.7.2 Pruning

Training of Tomato plants in the field A side shoot has been pinched

3.7.2 Pruning

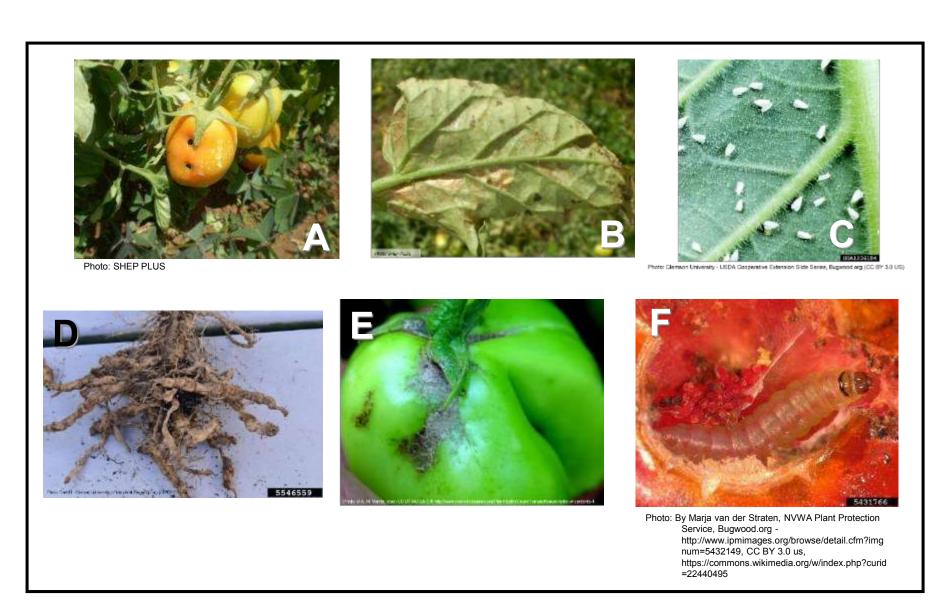

Training of Tomato plants in the field (A side shoot has been pinched)

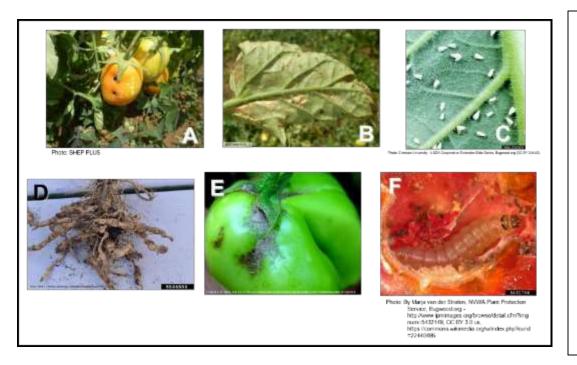

3.7.2 Pruning

- This practice is necessary for the indeterminate varieties
- It involves removal of side shoots, extra flowers, fruits and diseased leaves
- Leads to early maturity of fruits and encourages fruits to increase in size and uniformity
- Sterilize pruning blades by use of chlorine bleach and water at a ratio of 1:1. Use of unsterilized blades, and smoking can lead to spread of diseases e.g. TMV, Bacterial Wilt

3.8.1 Major Pests

3.8.1 Major Pests

3.8.1 Major Pests

- Pest damage causes a reduction in quality and quantity of produce
- The following are the major pests of Tomato in Kenya:
 - A. African Bollworm
 - **B.** Red Spider Mites
 - C. Tobacco Whitefly
 - D. Root-knot Nematode
 - E. Thrips
 - F. Tuta absoluta

3.8.1.A: African Bollworm

Symptom of fruit damaged by "African Bollworm"

3.8.1.A: African Bollworm

Symptom of fruit damaged by "African Bollworm"

3.8.1.A: African Bollworm

Identification:

- Adult moth is dull yellow to brown
- The female moth lays tiny round & brownish eggs near or on flowers or small fruits
- Larvae have alternating light and dark colored stripes on either side of the body
- The pupa is shiny brown

Damages:

- Caterpillars feed on flowers and green fruits causing flower abortion and sunken necrotic spots, respectively
- Feeding holes made by the caterpillar serve as entry point for bacteria and fungi which may lead to rotting of fruits

- Tilling & ploughing of old tomato field exposes pupa to desiccation and natural enemies
- Planting of trap crops (Cucumber, Maize & Africam Marigold) which attract the pest before it attacks tomatoes (Need to synchronize planting of both maize and tomatoes so that they flower at same time)
- Use of selective pesticides, such as microbial control agents:
 - Helocoverpa armigera SNPV Virus (Helitec SC®)
 - Indoxacarb (Avaunt 150SL®)
 - Etofenprox 30%(TREBON 30 EC®)

3.8.1.B: Red Spider Mites

Underside of Tomato leaf infested with "Red Spider Mites"

3.8.1.B: Red Spider Mites

Underside of Tomato leaf infested with "Red Spider Mites"

3.8.1.B: Red Spider Mites

Identification:

- Adult red spider mites are oval in shape, appear reddish or greenish with eight (8) legs
- Eggs are very tiny, spherical and whitish; and are laid singly on underside of leaves
- Red spider mites **spin silk threads** which anchor the pest and their eggs to the plant

Damages:

- Infested leaves show white to yellow speckling, later turn pale or bronzed
- High population causes serious drying and dropping of leaves (defoliation) which leads to smaller and lighter fruits

- Use of pesticides (miticides) including:
 - Spiromesifen (Oberon SC 240®)
 - Hexythiazox (Arsur 100 EC®)
 - Abamectin (Avirmec 1.8EC®, Almectin 1.8%EC®, Agrimec 18EC®)
 - Amitraz (Mitac 20EC®)
 - Amblyseius californicus (Amblytech®-predatory mite)
- Spider mites rapidly develop resistance to pesticides, especially when they are used continuously for several seasons
- To avoid development of resistance, farmers need to:
 - Use miticides with different modes of action and chemical composition/active ingredients- a.i
 - Avoid routine spraying
 - Use the recommended dosage

3.8.1.C: Tobacco Whitefly

Photo: Clemson University - USDA Cooperative Extension Slide Series, Bugwood.org (CC BY 3.0 US)

"Tobacco Whitefly" on the Tomato leaf

3.8.1.C: Tobacco Whitefly

"Tobacco
Whitefly" on the
Tomato leaf

3.8.1.C: Tobacco Whitefly

Identification:

- Adult whitefly resembles small white moth like insect which cluster on the underside of upper leaves from which they suck sap
- Eggs are laid in arc or circle on the underside of young leaves
- When eggs hatch they produce greenish white nymphs which resemble scales

Damages:

- Suck plant sap and remove nutrients which cause yellowing of infested leaves
- The larvae secrete honey dew which supports growth of black sooty mould
- Transmit viral diseases, especially Tomato Yellow Leaf Curl Virus (TYLCV)

- Keep tomato fields weed-free
- Use of **yellow sticky traps** to monitor their **population** levels
- Cover tomato seedling nurseries with nylon nets or insect proof nets to protect seedlings from Whitefly infestations
- Use of insecticides, such as (morning & ring spray)
 - Amitraz (Mitac 20EC®)
 - Buprofezin (Applaud 40%SC®)
 - Azadirachtin (Nimbecidine®)
 - Imidacloprid (Confidor 70 WG®)
 - Lambda Cyhalothrin (Karate 2.5WG®)
 - Lambda- cyhalothrin + Thiamethoxam (LEXUS 247 SC®)

3.8.1.D: Root-knot Nematode

Photo: David L. Clement, University of Maryland, Bugwood.org (CC BY 3.0 US)

Root galls: characteristic of "Root-knot Nematode" infestation

3.8.1.D: Root-knot Nematode

Root galls: characteristic of "Root-knot Nematode" infestation

3.8.1.D: Root-knot Nematode

Description:

- Nematodes are soil inhabitants easily spread by infested seedlings, soil washed down the slopes or by farm implements
- Root–knot nematodes are most serious on light sandy soils under furrow irrigation

Damages:

- Plants are stunted, become yellow and tend to wilt in hot weather
- The roots of infested plants are severely distorted, swollen and bear galls or knots
- Heavy infestation results in severe loss in yield

- Burn the top soil using waste plant material after seedbed preparation
- Solarize seedbeds if possible by covering soil with clear polythene sheet for 2 – 3 months
- Manuring of soil to reduce nematode population
- Fields should be ploughed deep and harrowed followed by dry fallow
- Use trap/ repellent crops such as Marigold
- Use of nematicides such as
 - Paecilomyces lilacinus (BIO-NEMATON 1.15% WP®)
 Azadirachtin (Nimbecidine®, Achook EC®)
 - Paecilomyces lilacinus (Mytech WP®)
 - Metham sodium (Metham sodium®)
 - Abamectin (Adventure 5G®)
 - Ethoprophos (MOCAP GR 10®)

3.8.1.E: Thrips

Symptoms of Thrips Damage on Tomato (Left) and TOSPO Virus Symptom (Right)

3.8.1.E: Thrips

Symptoms of Thrips damage on Tomato

Tospovirus symptom

3.8.1.E: Thrips

Identification:

- Adult thrips are small (0.5 2.0 mm), slender and winged
- Wings are long, narrow and fringed with long hairs
- Nymphs are white or yellow
- Both adult and nymphs feed on lower leaf surface, buds, flowers and fruits
- It transmits the Tomato Spotted Wilt Virus/ Tospovirus ("Kijeshi")

Damages:

- Attack on leaves causes speckling & small necrotic patches
- Heavy infestation causes premature wilting, delay in leaf development & distortion of young shoots
- Attack on buds and flowers leads to abortion

- Ploughing and harrowing before transplanting to kill pupae in the soil
- Use of insecticides, such as
 - Lambda-Cyhalothrin (Karate 2.5 WG®)
 - Abamectin + Acetamiprid (Amazing Top 100WDG®)
- Thrips are difficult to control with insecticides because their habits partially offer protection from insecticides (eggs are laid in plant tissue, adults shelter in flowers, and larvae pupate in soil)

3.8.1.F: Tuta Absoluta

Photo: By Marja van der Straten, NVWA Plant Protection Service, Bugwood.org - http://www.ipmimages.org/browse/detail.cfm?imgnum=5362149, CC BY 3.0 us, https://commons.wikimedia.org/w/index.php?curid=22430495

Tuta Absoluta adult (left) and larva (right)

3.8.1.F: Tuta Absoluta

Tomato Leafminer adult

Tomato Leafminer Iarva

3.8.1.F: Tuta Absoluta

Identification:

- The moth is grey-brown, same size and posture as diamond back moth (DBM) and has long antenna and lays up to 260 eggs
- Newly hatched caterpillars are small (0.5 mm) and yellowish
- Mature caterpillars (9 mm: fully grown are yellow-green, have pinkish color on the back and a black band behind the head
- Pupae is **light brown** and size is 6 mm
- The larva (caterpillar) is the damaging stage
- Distribution is through seedlings, containers, fruits, soil
 & Green houses

Photos: By Marja van der Straten, NVWA Plant Protection Service, Bugwood.org -

3.10.3.F: Tuta absoluta

Photo: By N3v3rl4nd - Own work, Public Domain, https://commons.wikimedia.org/w/index.php?curid=6598872

By Goldlocki - Own work, CC BY-SA 3.0, https://commons.wikimedia.org/w/index.php?curid=228832

Scouting on the leaves: Tomato Leafminer (left) *Tuta Absoluta* (right)

3.8.1.F: Tuta Absoluta

Damages:

- The caterpillar burrows (mines) in the middle of the leaf tissue
- Unlike other Leafminers, it feeds indiscriminately and from a distance, you see as if leaves are "burning"
- Most distinctive symptoms are the blotch-shaped mines in the leaves
- It bores on fruits, leaving symptomatic tiny holes
- It also burrows on stems causing breakages
- Can lead to 100% crop loss

Control:

- Early control is important before the pest pressure builds up
- Carry out cultural practices like field hygiene, crop rotation
- Carry out regular scouting/monitoring of pest population
- Use of pheromone traps to attract male insects for both monitoring/surveillance and pest control e.g.) mating disruption, mass trapping 'lure & kill' method, such as Tutrak traps
- Use of biological control agents, such as
 - Chlorantraniliprole (Coragen®)
 - Indoxacarb (Avaunt 150EC®, Merit 150SC®),
 Spirotetramat + Flubendiamide (Tihan OD®)
 - Thiocyclam 50% w/w; Thiocyclam-hydrogenoxalate (Evisect S®) and Imidacloprid (Grizly 175/30 SC®)
 - Flubendiamide (Belt 480SC®)
- The above pest control tactics should be combined in an IPM strategy

3-17c: common leaf miner infesting on leaves which normally does not affect the fruit

3.8.2 Major Diseases & Physiological Disorders

3.8.2 Major Diseases & Physiological Disorders

- Disease infection leads to reduction in quality and quantity of produce
- The following are the major diseases and physiological disorders of Tomato in Kenya:
 - a. Damping-off
 - b. Late Blight
 - c. Early Blight
 - d. Bacterial Wilt
 - e. Tomato Mosaic
 - f. Blossom-end Rot
 - q. Fusarium Wilt

"Damping-off" symptoms on seedlings

3.8.2.a: Damping-off

General Description:

This disease is soil borne

Symptoms:

- Decay of germinating seed
- Girdling of stem of young seedling at ground level

- Use of certified seed
- Avoid locating the seedbed on infested field
- Avoid excessive fertilizer application and watering to young seedlings while still at nursery bed
- Apply chemicals such as:
 - Metalaxyl + Mancozeb (Amidil 68WG)

3.8.2.b: Late Blight

"Late Blight" on foliage and fruits

3.8.2.b: Late Blight

General Descriptions:

- This is a fungal disease which affects foliage and fruits
- The development of the disease is favoured by cool and wet conditions

Symptoms:

- Irregular greenish-black water soaked patches on leaves
- The spots on the leaves later turn brown and the attacked leaves wither but remain attached to the stem
- Water soaked brown streaks on stem
- Grey water soaked spots on fruits usually the upper half of the fruit with foul smell

- Crop rotation
- Removal of all volunteer crops that are more susceptible to this disease
- Pruning and staking in order to improve air circulation and reduce humidity
- Use of fungicides, such as:
 - Metalaxyl + Mancozeb (Ridomil Gold MZ68®)
 - Propineb + Cymoxanil (Milraz WP76®)
 - Mancozeb (Dithane M45®)
 - Dimethomorph + Mancozeb (Acrobat MZ®)

3.8.2.c: Early Blight

Photo: SHEP PLUS

"Early Blight" on foliage

3.8.2.c: Early Blight

"Early Blight" on foliage

3.8.2.c: Early Blight

General Descriptions:

- This is a fungal disease which affects foliage and fruits
- The fungus is seed borne
- It is well adapted to semi-arid areas; warm wet weather
- The disease is favoured by warm rainy weather

Symptoms:

- Premature loss of lower leaves is the main symptom
- On leaves, brown circular spots with dark concentric rings
- Leaves turn yellow and dry when only a few spots appear
- On fruits, large sunken areas with dark concentric rings appearing velvet

- Use of certified seeds
- Appropriate spacing
- Avoid overhead irrigation, water in the morning and keep plants healthy/ stress-free
- Use of fungicides, such as
 - Chlorothalonil (Odeon® 82.5WDG)
 - Manconzeb (Oshothane®)
 - Propineb (Antracol WP70®)
 - Mancozeb + Cymoxanil (Agromax®)
 - Propineb + Iprovalicarb (Melody Duo®)

3.8.2.d: Bacterial Wilt

Symptom of "Bacterial Wilt" infection

3.8.2.d: Bacterial Wilt

Photo: Das Essis, Louisiana Sinta Liniuscolo Antinidado Center Barranot em CC RV 3 6 I Ki

Symptom of "Bacterial Wilt" infection

3.8.2.d: Bacterial Wilt

General Descriptions:

- This is a bacterial disease which is soil-borne
- It is easily spread by run off water and infested soil

Symptoms:

- Rapid wilting and death of entire plant without yellowing or spotting of leaves
- When the stem of a wilted plant is cut across, the pith has a darkened water – soaked appearance
- When stem of wilted plant is squeezed, a greyish slimy ooze is produced
- To distinguish this wilt from others when a thin slice is taken from the brown stem tissue and placed inside a glass of water, a milky ooze is produced from the cut surface

- Practice crop rotation with crops such as cereals
- Remove wilted plants, with the soil around roots, from the field and destroy
- Solarize planting beds
- Spot treatment with Sodium Hypochlorite at 10 % dilution (Jik) or with lime/ ash
- Sterilize pruning tools
- Use of Metam sodium (METHAM SODIUM 51 Liquid soluble®), Bronopol (ENRICH BM Wettable Powder®)

3.8.2.e: Tomato Mosaic Virus

Symptoms of "Tomato Mosaic Virus" infection on foliage and fruit

3.8.2.e: Tomato Mosaic Virus

General Descriptions:

- This is a viral disease which is easily transmitted by infected seed and plant debris in the soil
- Mechanically transmitted through transplanting seedlings and pruning tools

Symptoms:

- Mottling of leaves with raised dark green areas
- The shape of young leaves is distorted
- Internal browning of fruits, especially when fruits are affected at mature green stage

- Use certified disease-free seeds
- Remove crop debris and roots from the field
- Do not smoke or touch cigarettes as the virus is transmitted from tobacco leaves even if it is processed

3.8.2.f: Blossom-end Rot

3.8.2.f: Blossom-end Rot

Photo: M.E. Bartolo, Bugwood.org (CC BY 3.0 US)

Tomato fruits affected by "Blossom-end Rot"

3.8.2.f: Blossom-end Rot

General Descriptions:

 This is a physiological condition caused by calcium nitrogen imbalance in the soil, especially when moisture level in the soil is low

Symptoms:

- A rot at the blossom-end of the fruit
- The surface becomes dark brown and sunken

- Maintain adequate soil moisture, especially at fruit development stages
- Soil liming in calcium deficient soils, reduce N and mulch the field
- Top-dress with CN, Mavuno Planting and ensure adequate soil moisture
- Spray the crop with calcium chloride
- Foliar application of EASY-GRO CALCIUM®

3.8.2.g: Fusarium Wilt

Symptoms of Fusarium Wilt

3.8.2.g: Fusarium Wilt

Photo: © Scot Nelson (Public Domain Mark 1.0)

Symptoms of Fusarium Wilt

3.8.2.g: Fusarium Wilt

General Descriptions:

- The fungus is both seed- and soil-borne.
- It causes most damage on light, sandy soils.
- It is most active at temperatures between 25 and 32°C.
- The fungus can survive in the soil indefinitely even when no tomatoes are grown.
- It can also survive in fibrous roots of weeds (e.g. Amaranthus, Digitaria and Malva species).
- Acidic soils (pH 5.0 to 5.6) and excessive nitrogen fertilisation promote disease development.

Symptoms:

- The lower leaves of the plant usually turn yellow and die.
- Leaflets on one side may be affected while those on the other side are symptomless.
- Diseased leaves readily break away from the stem. When affected stems just above ground level and petioles are cut diagonally, a reddish-brown discolouration of the water conducting tissues will be observed.

- Use resistant tomato varieties (e.g. "Fortune Maker", "Rio Grande", "Tengeru 97", "Roma VFN", "Eden F1", "Rambo F1", "Anna F1").
- Use certified disease-free seeds.
- Do not locate seedbeds on land where Fusarium wilt is known to have occurred.
- Where soil is acidic, raise the pH by applying lime or farmyard manure.
- Avoid excessive nitrogen fertilisation and control root-knot nematodes.

4. Harvest

Harvesting of Tomatoes

4. Harvest

Harvesting of Tomatoes

4. Harvest

4.1 Harvesting Indices (GHCP&PHHT20: Q17)

- Maturity period range between 3 4 months after transplanting depending on:
 - The variety
 - Environmental conditions
- Tomato can be harvested at different stages depending on the market requirement and distance to the market
- There are four (4) main harvesting stages:
 - Mature-Green Stage: where the fruit is green but internal gel is well developed
 - Breaker/turning Stage: up to 30 % of fruit surface has definite color break from green to yellow
 - Pink/Light Red Stage: 30 90 % fruit surface has pink/red color
 - Red/Ripe Stage: over 90 % fruit surface has changed to red color
- Fruits should be harvested early in the morning when it is cool since the fruit temperature is low
- Harvested fruits should be kept in a cool, shaded and ventilated area in order to minimize heat gain
- Where necessary, wipe fruits to remove dirt
- The yields vary from 12,000 40,000kg per acre depending on the variety and crop husbandry

5. Post-Harvest Handling

Photo: SHEP PLUS

Graded tomatoes packed in crates

5. Post-Harvest Handling

Photo: SHEP PLUS

Graded tomatoes packed in crates

5. Post-Harvest Handling

- 5.1 Containers & Packaging Materials (GHCP&PHHT20: Q18)
- Tomatoes are normally packed in wooden & plastic crates
- 5.2 Value Addition Techniques: Cleaning, Sorting, Grading & Processing (GHCP&PHHT20: Q19)

Sorting:

Sorting is done to remove damaged or diseased fruits.

Grading:

- Tomatoes are graded depending on the uniformity of ripening and fruit size
- There are tree (3) main tomato grades:
 - Grade 1: big size fruits of uniform color and shape
 - Grade 2: medium size fruits of uniform color and shape
 - Grade 3: small size fruits with slight variation in color and shape

5. Post-Harvest Handling Cont'

Tomatoes in crates ready to be transported to the market
